what is python

Python is an interpreted, high-level, general-purpose programming language created by Guido van Rossum and first released in 1991. It is known for its ease of learning, making it a good starting point for new programmers. Python allows you to split your program into modules that can be reused in other Python programs and comes with a large collection of standard modules for various functionalities. It is designed to enable programs to be written compactly and readably, often resulting in shorter code compared to languages like C, C++, or Java.

give examples on how to code in pyhton

Here are some basic examples of how to code in Python:

1. Hello World Example:

```
print("Hello World!")
```

2. Variables:

```
a = 5
b = 10
sum = a + b
print("The sum is:", sum)
```

3. Using Functions:

```
def greet(name):
    return f"Hello, {name}!"

print(greet("Alice"))
```

4. If...Else Statement:

```
number = 10
if number > 0:
    print("The number is positive.")
else:
    print("The number is not positive.")
```

4. If...Else Statement:

```
number = 10
if number > 0:
    print("The number is positive.")
else:
    print("The number is not positive.")
```

5. For Loop:

```
for i in range(5):
    print("Iteration:", i)
```

6. While Loop:

```
count = 0
while count < 5:
    print("Count is:", count)
    count += 1
```

7. Using Lists:

```
fruits = ["apple", "banana", "cherry"]
for fruit in fruits:
    print(fruit)
```

These examples cover basic concepts such as printing output, using variables, defining functions, and control flow with loops and conditionals.

Ask a question about the documents

```
class Book(BaseModel):
    id: int
    title: str
    author: str
    publisher: str
```

4. Using POST to add a new book:

```
data = []

@app.post("/books/")
async def create_book(book: Book):
    data.append(book)
    return book
```

5. Using GET to read all books:

```
@app.get("/books/")
async def read_books():
    return data
```

These examples demonstrate how to set up a FastAPI application, define endpoints, and use Pydantic models for data validation.

no not fast api but the programming language we use to code fast api. give basic examples for that
